7. [Future Improvements](#)

1. Executive Summary

InsightPop **InsightPop** is an active intelligence assistant that transforms unstructured information flows (WhatsApp, emails, screenshots, photos, PDFs, and audios) into organized data and future actions. The app uses **adaptive intelligence** in its onboarding, where the AI adjusts its questions according to the responses it receives and the specific reality of each user. That is why it **knows what is important to you** and when it processes shared content, it identifies relevant data, generates personalized insights and notifications.

Useful for both the **micro-entrepreneur** who needs to manage leads, clients, and contracts, and for the **individual** who wants a "second brain" to not forget important details of personal and family life, its **predictive intelligence** is capable of suggesting the next step **even before you think** of it, helping you to always be one step ahead.

Intelligence: **Active → Adaptive → Predictive**

The project was architected as an agnostic engine **capable of adapting to any market niche** through a structure of dynamic attributes. It creates new "buckets" depending on what the user needs.

2. The Problem: Information Overload, Lack of Time and the Collapse of Personal Organization in Modern Life

We live at the height of communication, but the human brain cannot process and organize the amount of information it receives:

- **Forgetting Leads:** Loss of revenue by not offering services at the right time (e.g., buffet for a 1st birthday party for a client who did a baby shower months ago, resuming contact with a client who paused negotiations due to travel, etc.).
- **Personal Overload:** Details of medical appointments, academic commitments, family requests, school calendars, or future plans that die in the chat history and screenshots in the phone gallery.
- **Data Entry Friction:** Resistance to opening an app multiple times to register events, tasks, and reminders prevents data recording due to fatigue, procrastination, or lack of organization. If the entry is not automatic and intuitive, information is lost.

3. The Solution: InsightPop - Your Second Brain

The main competitive advantage is the **total autonomy of the ecosystem**: the user does not need to manually create events, tasks, or reminders in a calendar.

InsightPop is a "Share-First" app that works like this:

1. Versatile Input

The user shares directly to the app:

- A ZIP file (e.g., exported WhatsApp chat history)
- A PDF (e.g., a school calendar or a service contract)
- A screenshot (e.g., a birthday invitation)
- A **photo** (e.g., a notice with important information or a document)
- An audio **recording** (e.g., something important you recorded to remember)
- Copied text (e.g., from an email or a web page).

2. Multimodal Processing

The AI identifies identities, relevant facts, preferences, and **future intentions**, considering the rules it defined during account creation, according to the profile it configured with you, and the rules you created, which **make it know what is important to you**. It extracts everything relevant from the shared file and infers the actions you need to take, with respective dates (e.g., remind of the school meeting, charge the 2nd installment of the client's payment, or confirm attendance at a birthday party by the deadline).

3. Organization by Contexts

Clear separation between professional and personal life through isolated Workspaces.

4. Proactive Reminders

Native mobile notifications for future actions, based on automatically identified "triggers," eliminating the need for manual scheduling.

3.1. Practical Use Examples (User Stories)

Profile: The Proactive Entrepreneur (Sales and CRM)

"As an event planner, I want to share a negotiation history from WhatsApp so the app not only saves the contract details but automatically reminds me to offer a decoration upgrade 3 months before the party or get in touch for next year's birthday. I want to transform informal conversations into an intelligent sales funnel that works for me."

Profile: The Individual with Mental Overload (Second Brain)

"As a multitasking mother and professional, I want to send a screenshot of an invitation, a PDF of my daughter's school calendar, or a quick audio about a medical recommendation so the app extracts dates and tasks. The goal is to empty my mind of 'life maintenance tasks' (buying gifts, confirming attendance, scheduling follow-ups, school meetings), trusting that InsightPop will be my digital executive secretary that never forgets a detail."

Profile: The Student/Researcher (Knowledge Management)

"As a student in my final year, I want to forward photos of whiteboards, screenshots of notices, and audio insights so the AI organizes my schedule and sends me reminders like: *'You saved this calculus concept 3 days ago, how about reviewing it now for reinforcement?'* or *'The deadline for enrollment renewal is tomorrow, have you gathered the documents mentioned in the notice screenshot?'*. I want the app to transform the chaos of classes into an academic action plan."

3.2. Contextual Onboarding: The Adapted "Brain"

Unlike generic sign-ups, InsightPop uses onboarding to calibrate the AI's sensitivity. Upon first access, the user defines:

- **Persona:** (e.g., Entrepreneur, Student, Family Manager). This changes the AI's "tone" and extraction priority.
- **Priorities:** The user indicates what is critical (e.g., "Delivery dates," "Client food preferences," "Medication dosages," professional or personal life?).
- **Behavioral Rules:** Direct instructions for the AI (e.g., "Always suggest a follow-up 2 days after a quote," "Focus only on logistical data," "Morning activities should be reminded the day before").

- **Initial Knowledge Base:** A brief description of the user's reality (e.g., "I have two school-age children" or "I work with children's buffets focusing on parties for ages 1 to 5"), allowing the AI to make much more precise and personalized inferences.

3.3. User Journey (Paths and Flows)

To understand the value delivery, this is the mapping of all paths a user can take within the app ecosystem:

A. Entry Flow (Onboarding)

1. **Download & Open:** The user downloads the app and starts registration.
2. **Conversational Setup:** The app opens a chat (AI assistant) that interviews the user about their life/business.
3. **Rule Seeding:** The AI automatically generates the first "Guidelines" (behavioral rules) based on the chat. The user confirms.
4. **Dashboard Access:** The user enters the HomeScreen, divided into "Personal" and "Professional".

B. Data Capture Flow (Upload)

1. **Organic Sharing:** The user receives a long audio or file from a client on WhatsApp and clicks "Share with InsightPop". (Or clicks the "+" button directly in the app).
2. **AI Processing:** A loading screen informs that the AI is "reading" the data, extracting who the client is, what was requested, dates, and creating triggers (e.g., "Send contract tomorrow").
3. **Human Review (ConfirmScreen):** The app displays the structured data. The user can edit any field, add new keys, or delete irrelevant information before saving. If there is duplicate data (e.g., same client), the app suggests **Unification/Consolidation** of the information, to avoid creating multiple records for the same client or subject.
4. **Secure Storage:** The data is persisted in the database.

C. Action and Retrieval Flow (Engagement)

1. **Active Notification:** On the date of a "trigger" (Insights), the user's phone vibrates with a local notification (e.g., "Today: Charge 2nd installment for the 05/17/2026 event").
2. **Quick Action (via Push):** From the notification itself, the user can choose "Reschedule Insight" or "Delete Insight".

3. **Passive Search (Inquiry):** The user wants to remember something. They open the app, select the desired Workspace, and use the search bar (e.g., types the client's name or phone number) to find the Memory (record of data extracted from a file) immediately.

D. Behavioral Adjustment Flow

1. **Rule Calibration:** If the user notices that the AI always misses capturing something, they enter the “AI Rules” screen and create a new guideline, for example: *“Always capture financial values in Brazilian Reais”*.

2. **Continuous Adaptation - Post-MVP:** The saved memories will feed the AI, which will shape the tone and style of extraction without the user needing to ask, reaching a state of "personalized secretary."

4. Technological Differential: Flexibility and Vision

- **Context Architecture:** The app will have the capacity to manage different areas of life in a single database without mixing information.
- **Isolated Workspaces:** The user toggles between “Professional Mode” and “Personal Mode”. When importing a datum, they define the destination, and the AI applies specific “gavetas” (attributes) for that niche.
- **Dynamic Attribute Dictionary (EAV in NoSQL):** Instead of fixed columns, data is saved as flexible attributes (key/value), allowing the database to grow in an organized way according to each user's need.
- **Learning by Confirmation:** If the AI identifies new information, it suggests creating a new “gaveta” (column), awaiting human validation.
- **Behavioral Learning and Active Curation (Feedback Loop) - Post-MVP:** The system monitors which types of insights the user accepts, rejects, edits, or adds manually. These actions feed a dynamic “Relevance Profile” that personalizes future extractions. If the user habitually corrects the classification of certain data or details memories of a specific niche more, the AI learns this pattern and begins to perform extractions already adjusted to the user's organizational style and preferred level of detail, reducing the need for human intervention over time.
- **Response Evaluation (Rating System) - Post-MVP:** Direct feedback mechanism where the user rates the AI's accuracy after each processing. This data serves as a quality metric for continuous prompt refinement and personalized machine learning.
- **Image Reading (OCR):** Ability to interpret screenshots of conversations for immediate data extraction without needing to export full histories.

5. Development Roadmap

Phase 1: Backend and Intelligence Core

- **Focus:** Personal use and Professional Event Organization.
- **Technology:** Backend in Python (FastAPI + Docker) and Mobile in React Native.
- **AI:** Robust integration with Gemini API (Smart Scoring, multi-key, and automatic Fast-Fail).
- **Functionality:** Receive screenshots, ZIPs, PDFs, audios, images, and Texts, classify Context (Personal/Professional), and save in MongoDB. Secure user authentication (bcrypt) and testing.

Phase 2: Mobile App and UX

- **Interface:** Unified semantic Design System, memory management, and manual consolidation of insights.
- **Onboarding:** Interactive chat with AI during account creation to define profile and initial rule suggestions.
- **Reminders (Snooze):** Intelligent notification system scheduled via app, allowing to complete, reschedule, or delete tasks directly on the phone.

Phase 3: Security, Scalability, and Clean Architecture

- **Backend Security:** Architecture in SOLID patterns and clean code in backend (FastAPI). Professional logging, global exception handling, Rate Limiting, and dynamic environment validation.
- **Mobile:** Adoption of global state (Zustand), form validation (Zod), and improved imports.
- **Essential Account Management:** Account deletion (User Right / App Store Requirement).

Phase 4: Engagement, AI Evolution, and Scalability (Post-MVP)

- **AI and Feedback Loop:** Evaluation mechanism for the app/insights (Rating/Stars) and comparison between the AI-generated and user-saved data.
- **Legal & Security:** LGPD, Terms of Use, Privacy Policies, and OTP authentication (2FA).
- **Advanced Features:** Recurring notifications (monthly/annual suggested by AI) and Semantic Searches through Memories (records extracted from user-uploaded files).
- **Monetization and Launch:** Creation of subscription screen (Paywall), visual presentation (App Store / Play Store), and final launch.

6. Structure and Investment

MVP Structure (Zero Cost)

- **Developer:** Vania Iott (Founder).
- **Hosting:** Server (FastAPI) and MongoDB in local Docker containers.
- **AI:** Google Gemini (Free Tier).
- **Distribution:** Direct installation (APK) for rapid validation.

Scale Structure (Post-MVP)

- **Cloud Hosting:** AWS/Google Cloud (Estimated: \$10 - \$30/month).
- **Store Fees:** Google Play (\$25 one-time) / Apple Store (\$99 annually).

Monetization Model (Retention and Value)

- **Beta Phase (Initial):**
 - Testing with all features released for free to a restricted group of user evaluators.
 - *Key Metric:* Define the average upload limit (MB) a power user generates, to size quotas without exceeding costs.
- **Launch (Scalable Freemium):**
 - **Trial:** 30 days of unlimited use (with a protective quota ceiling) for conversion.
 - **Individual Plan (\$3.00 to \$5.00/month):** 1 Workspace (Personal) + Estimated Limit of 250 MB processing/month.
 - **Pro Plan (\$6.00 to \$8.00/month):** 2 Workspaces (Professional + Personal) + Estimated Limit of 1 GB processing/month.
 - **One-time Top-ups (MB Packs):** If the limit is reached, purchase extra capacity that does not expire (e.g., +100 MB for \$1.00).
 - **Free Status:** After the trial, if not subscribed, the user maintains lifetime access to read old data and continues receiving notifications, but intelligent AI extraction is deactivated.

7. Future Improvements (Beyond the Current Roadmap)

- **Synchronization:** Implementation of cloud backup and real-time synchronization between devices.

- **Native integration with Google Calendar.**
- **Sentiment Analysis:** Identify urgency or satisfaction in processed conversations.
- **Auto-Draft:** Suggested ready-to-use text for responses or follow-ups based on client history.
- **Audio Analysis:** Advanced native voice transcription.
- **New Data Sources (Uploads):** Native support for processing video/audio files (MP4) using the AI File API and automatic text extraction from internet links and pages (URLs).
- **Family/Team Management:** Shared profiles for domestic reminders or sales teams.
- **Web Platform:** Creation of a dedicated WebApp for more analytical management on desktop.
